# Sets and Dictionaries

# **Exercises**

۱۸	/	Д	Д	k	7
v	•	<b>G</b>	<b>T</b>	r\	- /

Prior to attempting these exercises ensure you have read the lecture notes and/or viewed the video, and followed the practical. You may wish to use the Python interpreter in interactive mode to help work out the solutions to some of the questions.

Download and store this document within your own filespace, so the contents can be edited. You will be able to refer to it during the test in Week 6.

Enter your answers directly into the highlighted boxes.

For more information about the module delivery, assessment and feedback please refer to the module within the MyBeckett portal.

Specify two ways in which a Set varies from a List.
Answer:
Two wave are Uniqueness and Ordering

\_\_\_\_\_

Write a Python statement that uses the  $\mathtt{set}$  ()  $\emph{constructor}$  to produce the same Set as the following -

```
languages = { "C++", "Java", "C#", "PHP", "JavaScript" }
```

# Answer:

```
languages = set(["C++", "Java", "C#", "PHP", "JavaScript"])
```

# Is a Set mutable or immutable?

#### Answer:

Its Mutable.

Why does a Set not support *indexing* and *slicing* type operations?

#### Answer:

Its because a set is unordered.

Why is a frozenset () different from a regular set?

### Answer:

A frozenset() is immutable, while a regular set is mutable.

How man	y elements would exist in the following set?
names =	set("John", "Eric", "Terry", "Michael", "Graham", "Terry")
Answer:	
Its 6 Elen	nents.
And how	many elements would exist in this set?
vowels	= set("aeiou")
Answer:	
Its 5 elem	ients.
What is th	ne name given to the following type of expression which can be used to
programn	natically populate a set?
chars =	{chr(n) for n in range(32, 128)}
Answer:	
	omprehension.
What <b>ope</b> sets?	erator can be used to calculate the intersection (common elements) between two
Seis?	
Answer:	
& operato	or.
What <b>ope</b>	erator can be used to calculate the difference between two sets?
_	
Answer:	oo ( ) operator
Dillerenc	ce (-) operator

What would be the result of each of the following expressions?

```
\{ "x", "y", "z" \} < \{ "z", "u", "t", "y", "w", "x" \}
```

Answer:

True

```
\{ "x", "y", "z" \} < \{ "z", "y", "x" \}
```

Answer:

False

```
\{ \text{"x", "y", "z"} \} \leftarrow \{ \text{"y", "z", "x"} \}
```

Answer:

True

```
\{ \|x\| \} > \{ \|x\| \}
```

Answer:

False

$$\{ "x", "y" \} > \{ "x" \}$$

Answer:

True

```
\{ "x", "y" \} == \{ "y", "x" \}
```

Answer:

True

Write a Python statement that uses a **method** to perform the equivalent of the following operation -

```
languages = languages | { "Python" }
```

Answer:

languages.add("Python")

Do the elements which are placed into a set always remain in the same position?
Answer:
No, the elements in a set are unordered.
Is the following operation a <b>mutator</b> or an <b>accessor</b> ?
languages &= oo_languages
Answer:
Its Mutator.
What term is often used to refer to each <i>pair</i> of elements stored within a <b>dictionary</b> ?
Answer:
Its Key-value pair.
Is it possible for a dictionary to have more than one <b>key</b> with the same value?
Answer:
Yes, it is possible.
Is it possible for a dictionary to have the same <b>value</b> appear more than once?
Answer:
Yes, It is possible.

Is a Dictionary mutable or immutable?
Answer:
Its mutable.
Are the <b>key</b> values within a dictionary <b>mutable</b> or <b>immutable</b> ?
Answer:
Its Immutable.
How many elements exist in the following dictionary?
stock = {"apple":10, "banana":15, "orange":11}
Answer:
3 Elements.
And, what is the data-type of the <b>keys</b> ?
Answer:
print(stock["banana"]):
And, what output would be displayed by executing the following statement -
<pre>print(stock["banana"])</pre>
Answer:
15
Write a Python statement that uses the dictionary () constructor to produce the same dictionary as the following -
<pre>lang_gen = { "Java":3, "Assembly":2, "Machine Code":1 }</pre>
Answer:
lang_gen = dict([("Java", 3), ("Assembly", 2), ("Machine Code", 1)])

dictionary.
Answer:
"Assembly" in lang_gen.
7.636mbly in lang_gen.
We'te same Dath as and that were a Societation of the Standard and distinguished
Write some Python code that uses a for statement to iterate over a dictionary called
module_stats and print only its values (i.e. do not output any keys) -
Answer:
for value in module_stats.values():
print(value)
New write another loop which prints the only the leave
Now write another loop which prints the only the <b>keys</b> -
Answer:
for key in module_stats.keys():
print(key)
Is it possible to construct a dictionary using a <b>comprehension</b> style expression, as
supported by lists and sets?
Answer:
Yes, its possible using a comprehension.
When a Dictionary type value is being passed as an argument to a function, what characters
can be used as a prefix to force the dictionary to be <b>unpacked</b> prior to the call being made?
Answer:
Its double asterisk (**).

Now write a simple expression that tests whether the word " ${\tt Assembly}$ " is a member of the
